The Importance of Laboratory Animal Genetics, Health, and the Environment in Biomedical Research documents the proceedings of the Fifth Charles River International Symposium on Laboratory Animals, in Heidelberg, Federal Republic of Germany, March 14-16, 1983. These papers examine how the health and genetic monitoring of laboratory animals, coupled with environmental influences, affect the investigations of oncologists, toxicologists, or pharmacologists.

The book is organized into four parts. Part I focuses on the health monitoring of laboratory animals for biomedical research. It includes studies on the effects of health and health monitoring in toxicology studies, oncology studies, and pharmacologic studies. Part II deals with the genetic monitoring of laboratory animals. It examines the causes of genetic alternation in laboratory animals and ways to prevent them. Part III considers the environmental monitoring that is necessary for research on laboratory animals. Part IV on new research frontiers includes studies on the production of monoclonal antibodies for the experimental and therapeutic modulation of laboratory animals, and the quality control aspects of animal experimentation.
